How does a 24V power inverter work?

This 24V to 230V power inverter converts 24V battery output (DC) into the 230V mains output required for domestic appliances (AC). It generates pure sine wave electricity - identical to the electricity supplied by utility companies.

How much power does a 24V inverter consume?

A good sized 24V inverter could use about as much power just being on as your lights do. If the lights consume 45 watts and run for 12 hours a day, the total power usage would be 45 watts x 12 hours = 540 watts. The battery power required for losses plus the load could double that. The lights themselves may be DC, using a small transformer (wall wart) to go from 120Vac to (likely) 12Vdc.

What is the difference between a 24v and 12V inverter?

The main difference is the input voltage. A 24V inverter is suited for larger battery systems and can handle more power, making it ideal for bigger appliances. A 12V inverter is typically used for smaller systems and devices. Need more help?
