Which GPS receiver should be used for a post-processed survey?

First-order, second-order, and third-order post processed GPS surveys require GPS receivers that are capable of recording data. When performing specific types of GPS surveys (i.e. static, fast-static, and kinematic), receivers and software shall be suitable for the specific survey as specified by the manufacturer.

What is a base station?

A base station is comprised of a GPS receiver, an antenna, and a tripod. The GPS receiver and the antenna shall be suitable for the specific survey as determined from the manufacturer's specifications. Tripod requirements are specified in Section 6B.3-3.

What is an independent baseline for a GPS survey?

For first-order and second-order GPS surveys, an independent baseline shall be produced between stations that are closer than 20 percent of the total distance between those stations traced along existing or new connections.

What is a total station survey system?

Total stations are always improving. As the equipment improves, new specifications will be developed and existing specifications will be changed. The TSSS is a system that includes a total station survey instrument and an electronic data collecting system. The system also includes tripods, tribrachs, prisms, targets and prism poles.

These Standards and Guidelines provide guidance to the Government cadastral surveyor and other land surveyors in the use of Global Positioning System (GPS) technology to perform ...

The FGCS standards and specifications have been modified to meet the specific needs and requirements for various types of first-order, second-order, third-order, and general-order GPS ...

This document provides guidelines for conducting base station surveys to support mobile network planning and engineering. It outlines important preparation steps, such as ...

Access comprehensive standards, guidelines, and best practices for professional land surveying. These resources ensure consistency and excellence across the industry.

Access comprehensive standards, guidelines, and best practices for professional land surveying. These resources ensure consistency and ...

Primary and secondary base stations can be newly established stations in this project. A sample project with observing scheme is depicted in figure 1 located at the end of the section. A ...

Three levels of Global Positioning System (GPS) surveying have been established by TxDOT to aid in maintaining standards of accuracy for different types of GPS surveys.

This document provides guidelines for conducting base station surveys to support mobile network planning and engineering. It outlines ...

Technical specifications, procedural guidance, and quality control criteria are outlined for the consistent provision of surveying services in support of USACE activities. The New Orleans...

Survey specifications describe the methods and procedures needed to attain a desired survey accuracy standard. Specifications in this section are based on Federal ...

Introduction rming accurate surveys with a Survey Grade GPS system. Minimum accuracy class standards for different survey applications are summarized below

As is known, not all survey equipment is manufactured to the same standard. The use o 97 technologies and different equipment manufacturers will provide different results. It is up to the ...
