-----

`super()` lets you avoid referring to the base class explicitly, which can be nice. But the main advantage comes with multiple inheritance, where all sorts of fun stuff can happen.

By twisting the PANI-TPU fiber film a certain number of turns, a fiber supercapacitor capable of stabilizing under large tensile ...

As for chaining `super::super`, as I mentionned in the question, I have still to find an interesting use to that. For now, I only see it as a hack, but it was worth mentioning, if only for the differences ...

"super" object has no attribute "`__sklearn_tags__`". This occurs when I invoke the fit method on the `RandomizedSearchCV` object. I suspect it could be related to compatibility ...

What is the difference between `List<? super T>` and `List<? extends T>`? I used to use `List<? extends T>`, but it does not allow me to add elements to it `list.add(e)`, whereas the `Li...`

I wrote the following code. When I try to run it as at the end of the file I get this stacktrace: `AttributeError: "super" object has no attribute do_something` class Parent: def ...

By twisting the PANI-TPU fiber film a certain number of turns, a fiber supercapacitor capable of stabilizing under large tensile deformations is achieved.

Given the rise in the popularity of wearable electronics that are able to deform into desirable configurations while maintaining electrochemical functionality, stretchable and flexible (hybrid) ...

In fact, multiple inheritance is the only case where `super()` is of any use. I would not recommend using it with classes using linear inheritance, where it's just useless overhead.

Therefore, we prepared stretchable conducting polymer electrodes by depositing thiophene and 3-methylthiophene on patterned 304 stainless steel (SS 304) through ...

Imagining an advanced smartphone, a miniature, light-weight, flexible electronic device with good power and energy capability, large-scale stretchability, and self-healing ...

I'm currently learning about class inheritance in my Java course and I don't understand when to use the `super()` call? Edit: I found this example of code where `super.variable` is used: `class A { ...`

Stretchable and flexible supercapacitors (SCs) are energy storage devices that provide ultrahigh power density while having long-term durability, high security, and electrochemical stability.

In the journal *Angewandte Chemie*, Chinese scientists have introduced an extraordinarily stretchable and compressible polyelectrolyte which, in combination with carbon ...
